Outlook Webaccess op Exchange 2003 en NetASQ SSL vpn

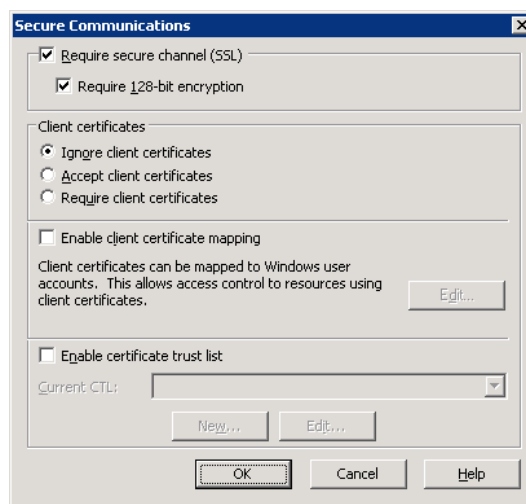

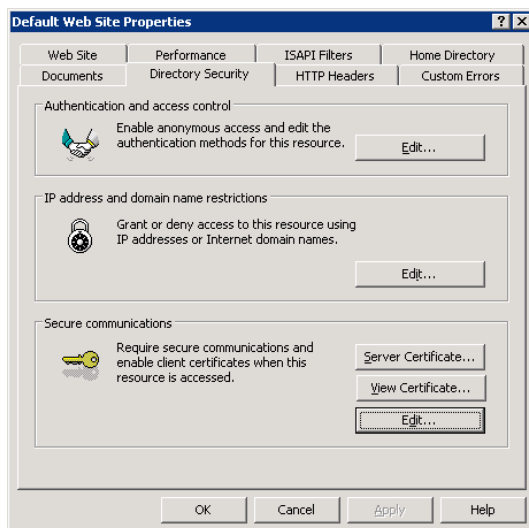

Zorg ervoor dat onderstaande opties ingesteld staan op de NetASQ.

- First of all, make sure the option *Webdav Support* has been enabled in *Intrusion Prevention / Plugins / HTTP*.
- Then make sure the URL group *vpnssl_owa* is part of your URL groups.
- Also make sure that the option *Authorize WebDAV Protocol* has been enabled in *Proxy / HTTP Proxy / HTTP extension*.
- Then all you need is to create web access in your SSL VPN configuration using *New / HTTP Server - OWA* (this will enable the option *Disable NTLM authentication method* and will add the *vpnssl_owa* URL group to your white list).

Ensure that the option `Rewrite User Agent` has been selected at the server level so that you are in compatibility mode with the OWA server.

Zorg er vervolgens voor dat de /Exchange map in IIS over http benaderd mag worden door de volgende optie uit te zetten. Ga naar de eigenschappen van de

folder
en kies

Directory Security/ Kies bij Secure

Communications edit.

zet de optie require secure channel uit.

Nu zou Exchange 2003 Webaccess moeten werken.
